NEW QUESTION: 3
Your company has a main office and two branch offices. The main office is located in New York. The branch offices are located in Seattle and Chicago.
The network contains an Active Directory domain named contoso.com. An Active Directory site exists for each office. Active Directory site links exist between the main office and the branch offices. All servers run Windows Server 2012 R2.
The domain contains three file servers. The file servers are configured as shown in the following table.

You implement a Distributed File System (DFS) replication group named ReplGroup.
ReplGroup is used to replicate a folder on each file server. ReplGroup uses a hub and spoke topology.
NYC-SVR1 is configured as the hub server.
You need to ensure that replication can occur if NYC-SVR1 fails.
What should you do?
A. Modify the properties of ReplGroup.
B. Create an Active Directory site link.
C. Create a connection in ReplGroup.
D. Create an Active Directory site link bridge.

Answer: C
Explanation:
Explanation/Reference:
Explanation:

A: The Bridge all site links option in Active Directory must be enabled. (This option is available in the Active Directory Sites and Services snap-in.) Turning off Bridge all site links can affect the ability of DFS to refer client computers to target computers that have the least expensive connection cost. An Intersite Topology Generator that is running Windows Server 2003 relies on the Bridge all site links option being enabled to generate the intersite cost matrix that DFS requires for its site-costing functionality. If you turn off this option, you must create site links between the Active Directory sites for which you want DFS to calculate accurate site costs.
Any sites that are not connected by site links will have the maximum possible cost.
