IP flow verify checks if a packet is allowed or denied to or
from a virtual machine. The information consists of direction,
protocol, local IP, remote IP, local port, and remote port. If
the packet is denied by a security group, the name of the rule
that denied the packet is returned. While any source or
destination IP can be chosen, IP flow verify helps
administrators quickly diagnose connectivity issues from or to
the internet and from or to the on-premises environment.

You have an Azure subscription named Subscription1.
Subscription1 contains a virtual machine named VM1.
You install and configure a web server and a DNS server on VM1.
VM1 has the effective network security rules shown in the
following exhibit.

Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.
NOTE: Each correct selection is worth one point.

Answer:
Explanation:

Explanation:
Box 1:
Rule2 blocks ports 50-60, which includes port 53, the DNS port. Internet users can reach to the Web server, since it uses port 80.
Box 2:
If Rule2 is removed internet users can reach the DNS server as well.
Note: Rules are processed in priority order, with lower numbers processed before higher numbers, because lower numbers have higher priority. Processing stops once traffic matches a rule, as a result, any rules that exist with lower priorities (higher numbers) that have the same attributes as rules with higher priorities are not processed.
