NEW QUESTION: 1
You work as the Enterprise Exchange Administrator at ABC.com.
The ABC.com network consists of a domain named ABC.com. ABC.com
has acquired a new server named ABC-EX01 that is running
Microsoft Exchange Server 2010.
What action must you take to give employees access to ABC-EX01
from the Internet using Exchange ActiveSync?
A. You must change the Microsoft-Server-ActiveSync virtual
directory's external URL.
B. You must use DNS forwarding.
C. You must enable recipient filtering.
D. You must use Send connectors.
Answer: A

NEW QUESTION: 2
Which of the following password attacks is MOST likely to crack
the largest number of randomly generated passwords?
A. Hybrid
B. Dictionary
C. Birthday attack
D. Rainbow tables
Answer: D
Explanation:
When a password is "tried" against a system it is "hashed"
using encryption so that the actual password is never sent in
clear text across the communications line. This prevents
eavesdroppers from intercepting the password. The hash of a
password usually looks like a bunch of garbage and is typically
a different length than the original password. Your password
might be "shitzu" but the hash of your password would look
something like
"7378347eedbfdd761619451949225ec1".
To verify a user, a system takes the hash value created by the
password hashing function on the client computer and compares
it to the hash value stored in a table on the server. If the
hashes match, then the user is authenticated and granted
access.
Password cracking programs work in a similar way to the login
process. The cracking program starts by taking plaintext
passwords, running them through a hash algorithm, such as MD5,
and then compares the hash output with the hashes in the stolen
password file. If it finds a match then the program has cracked
the password.
Rainbow Tables are basically huge sets of precomputed tables
filled with hash values that are pre-matched to possible
plaintext passwords. The Rainbow Tables essentially allow
hackers to reverse the hashing function to determine what the
plaintext password might be.
The use of Rainbow Tables allow for passwords to be cracked in

a very short amount of time compared with brute-force methods, however, the trade-off is that it takes a lot of storage (sometimes Terabytes) to hold the Rainbow Tables themselves. With a rainbow table, all of the possible hashes are computed in advance. In other words, you create a series of tables; each has all the possible two-letter, three-letter, four-letter, and so forth combinations and the hash of that combination, using a known hashing algorithm like SHA-2. Now if you search the table for a given hash, the letter combination in the table that produced the hash must be the password you are seeking.
