Answer: C

NEW QUESTION: 2
Which of the following types of attacks involves interception of authentication traffic in an attempt to gain unauthorized access to a wireless network?
A. Near field communication
B. Evil twin
C. Replay attack
D. IV attack
Answer: D
Explanation:
An initialization vector is a random number used in combination

with a secret key as a means to encrypt data. This number is sometimes referred to as a nonce, or "number occurring once," as an encryption program uses it only once per session.
An initialization vector is used to avoid repetition during the data encryption process, making it impossible for hackers who use dictionary attack to decrypt the exchanged encrypted message by discovering a pattern. This is known as an IV attack.
A particular binary sequence may be repeated more than once in a message, and the more it appears, the more the encryption method is discoverable. For example if a one-letter word exists in a message, it may be either "a" or "I" but it can't be "e" because the word "e" is non-sensical in English, while "a" has a meaning and "I" has a meaning. Repeating the words and letters makes it possible for software to apply a dictionary and discover the binary sequence corresponding to each letter.
Using an initialization vector changes the binary sequence corresponding to each letter, enabling the letter "a" to be represented by a particular sequence in the first instance, and then represented by a completely different binary sequence in the second instance.
WEP (Wireless Equivalent Privacy) is vulnerable to an IV attack. Because RC4 is a stream cipher, the same traffic key must never be used twice. The purpose of an IV, which is transmitted as plain text, is to prevent any repetition, but a 24-bit IV is not long enough to ensure this on a busy network. The way the IV was used also opened WEP to a related key attack. For a 24-bit IV, there is a 50% probability the same IV will repeat after 5000 packets.

NEW QUESTION: 3
Which of the following refers to a network that spans several buildings that are within walking distance of each other?
A. WAN
B. CAN
C. PAN
D. MAN
Answer: B
Explanation:
CAN stands for Campus Area Network or Corporate Area Network. Universities or colleges often implement CANs to
link the buildings in a network. The range of CAN is 1KMto 5KM. If multiple buildings have the same domain and they
are connected with a network, then it will be considered as a CAN.
